Although the large latent heat of pure PCMs enables the storage of thermal energy, the cooling capacity and storage efficiency are limited by the relatively low thermal conductivity ($\approx 1/4 \text{ W/(m} \cdot \text{K)}$) when compared to metals ($\approx 1/4 \text{ } 100 \text{ W/(m} \cdot \text{K)}$). 8, 9 To achieve both high energy density and cooling capacity, PCMs having both high latent heat and high thermal conductivity are required.
