How do energy storing bricks work? Here is the step-by-step process overview of how energy storing bricks work: Prepare a mixture of hydrochloric acid and water, and heat it to 160°C. This acid vapor will dissolve the iron oxide in the bricks and release ferric ions. Place the bricks in a chamber and expose them to the acid vapor for about 10 minutes.

How can energy storing bricks evolve in the future? Some of the ways that energy storing bricks can evolve in the future are: Increase the energy the bricks store using different types of conductive polymers, additives, or composites. This could improve the performance and efficiency of these bricks.
