

BOX ENERGY MADAGASCAR

How much energy does Madagascar use? Madagascar's energy balance shows that about 80% of its overall energy consumption is based on biomass (mainly firewood 68%, charcoal 10% and other biomass 2%), 17% on petrol (transport), 2% on electricity (hydropower and diesel power plants) and 1% on coal. Until today the petroleum products are all imported.

How many people have access to electricity in Madagascar? Access to electricity remains low with about 20% of the total population having access to this form of modern energy. In the rural areas, only about 5% have access to electricity. The installed capacity of electricity production in Madagascar accounts accordingly for some 650 MW only (production in 2008 = 486 GWh).

Is biomass a source of energy in Madagascar? Traditional biomass, the burning of charcoal, crop waste, and other organic matter is not included. This can be an important energy source in lower-income settings. Madagascar: How much of the country's energy comes from nuclear power?

What are Madagascar's energy issues and bottlenecks? Power Africa lists the following as Madagascar's energy sector's top issues and bottlenecks : Ministre de l'Eau, de l'Energie et des Hydrocarbures (MEEH): responsible for the national energy policy and coordination of the activities in the energy sector.

Does Madagascar have oil? Even though Madagascar has oil in place, the oilfields are not being exploited yet. The energy consumption per head is around 0,2 tons oil equivalent, which is one of the lowest in the world. Access to electricity remains low with about 20% of the total population having access to this form of modern energy.

BOX ENERGY MADAGASCAR

Does Madagascar have a national electricity grid? Lack of a national distribution grid: Madagascar does not possess a countrywide electricity grid. The national power utility JIRAMA is operating selected grids only around major towns with the longest stretching between the capital Antananarivo and Antsirab? with an overall length of approx. 180 km.

It also includes non-energy uses of energy products, such as fossil fuels used to make chemicals. Some of the energy found in primary sources is lost when converting them to useable final products, especially electricity. As a result, the breakdown of final consumption can look very different from that of the primary energy supply (TES).
