What are modern design approaches to electric energy storage devices? Modern design approaches to electric energy storage devices based on nanostructured electrode materials, in particular, electrochemical double layer capacitors (supercapacitors) and their hybrids with Li-ion batteries, are considered.

What is electric double layer capacitor (EDLC)? Electric double layer capacitor (EDLC) [1,2] is the electric energy storage system based on charge/discharge process (electrosorption) in an electric double layer on porous electrodes, which are used as memory back-up devices because of their high cycle efficiencies and their long life-cycles. A schematic illustration of EDLC is shown in Fig. 1.

Who invented the electric double layer theory? The earliest electric double layer theory was proposed by Helmholtz and further supplemented and developed by Gouy, Chapman, Grahame, and Stern. It regulates the electrochemical processes occurring at the electrostatic interface between a charged electrode material and an electrolyte.
