Battery storage will be a necessary technology once renewable energy accounts for 40-50% of the energy mix, Zahran said, who said that it could be done in less than 10 years provided the government reforms the energy market. For now, battery storage could be a viable solution in remote locations that are costly to connect to the national grid

The importance of Electric Energy Storage (EES) for the transformation to an energy grid with a large share of Renewable Energy Source (RES) has been studied and shown for many decades. While larger storage systems might provide more energetic benefits for the overall grid, they also require higher investment and capital costs.

Accordingly, the development of an effective energy storage system has been prompted by the demand for unlimited supply of energy, primarily through harnessing of solar, chemical, and mechanical energy. Nonetheless, in order to achieve green energy transition and mitigate climate risks resulting from the use of fossil-based fuels, robust energy
