

ELECTRICAL EQUIPMENT TRIP NODES FOR ENERGY STORAGE

What is electrical energy storage (EES)? Electrical Energy Storage, EES, is one of the key technologies in the areas covered by the IEC. EES techniques have shown unique capabilities in coping with some critical characteristics of electricity, for example hourly variations in demand and price.

Can electrical energy storage solve the supply-demand balance problem? As fossil fuel generation is progressively replaced with intermittent and less predictable renewable energy generation to decarbonize the power system, Electrical energy storage (EES) technologies are increasingly required to address the supply-demand balance challenge over a wide range of timescales.

Why is electric energy storage so popular? Increased interest in electrical energy storage is in large part driven by the explosive growth in intermittent renewable sourcessuch as wind and solar as well as the global drive towards decarbonizing the energy economy.

Which EES technologies can be used for power system applications? Owing to the similarity in technical performance of other EES technologies to PHES or LIBs, as shown in Fig. 2, other types of EES technologies could be used for power system applications. Mechanical storage like CAES, PHES, LAES, TES and GES, as well as RFB, are suitable for providing energy time shifting and seasonal/long-duration energy storage.

Could a low-cost electrochemical battery serve the grid? The energy storage capacity could range from 0.1 to 1.0 GWh, potentially being a low-cost electrochemical battery option to serve the grid as both energy and power sources. In the last decade, the re-initiation of LMBs has been triggered by the rapid development of solar and wind and the requirement for cost-effective grid-scale energy storage.

Coordinated, consistent, interconnection standards, communication standards, and implementation guidelines are required for energy storage devices (ES), power electronics connected distributed energy resources (DER), hybrid generation-storage systems (ES-DER), and plug-in electric vehicles (PEV).
