

ENERGY STORAGE CAN COMMUNICATION

Why is internal communication important in energy storage systems?
Efficient internal communication within energy storage systems (ESS) is critical for ensuring stable operation, optimal performance, and safety management.

Why should energy storage battery systems use CAN protocol? 1. High reliability and real-time performance: Energy storage battery systems usually require real-time monitoring and control to ensure safety and performance. The CAN protocol has optimized conflict detection and fault tolerance mechanisms, which can provide high reliability and real-time data transmission. 2.

Can a Bess be used with a battery energy storage system?
Measurements of battery energy storage system in conjunction with the PV system. Even though a few additions have to be made, the standard IEC 61850 is suited for use with a BESS. Since they restrict neither operation nor communication with the battery, these modifications can be implemented in compliance with the standard.

When can large quantities of electricity be stored and retrieved? Large quantities of generated electricity can be stored and retrieved anytime too little power is produced. Such a scenario can only be implemented when data is exchanged properly among a BESS, PV system and control system.

What is can & how does it work? Multi-master-slave communication: CAN supports parallel communication of multiple devices, which is suitable for battery systems with master-slave architecture, and can achieve efficient communication between the master control unit and the slave module. 3.

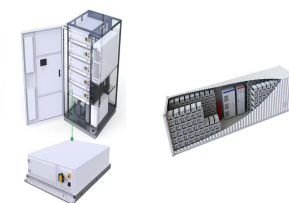

ENERGY STORAGE CAN COMMUNICATION

How does the control center communicate with the PV system? The control center communicates with the PV system by a Modbus protocol and with the BESS by IEC 61850. The IEC 61850 data structures provided by the BESS were created beforehand by a configuration file. Fig. 5 presents a schematic of this structure.
