How does Thermal Storage Energy Work? At nighttime during off-peak hours, the water containing 25% ethylene glycol is cooled by a chiller. The solution gets circulated in the heat exchanger within the ice bank, freezing 95% of the water that surrounds the heat exchanger in the ice bank, freezing 95% of the water that is present around the heat exchanger in the tank.

As the title of this class of energy storage represents, it is about storing thermal energy (heat or cold) for later use. However, it does not necessarily mean that the incoming energy flow into the energy storage unit has to be either heat or cold. For example, in many recent innovations, high-temperature heat storage has been considered for
