What is the enthalpy of a smart firewall? The SCCS has the highest enthalpy of 2.56 kJ g<sup>-1</sup>, because additional heat is absorbed by the precipitation of CaCl<sub>2</sub>. These results indicate that in contrast to pure thermal insulation materials, the prepared smart firewall is better equipped with a heat absorption/cooling function.

How secure is the energy platform? The energy platform is certainly an ideal mechanism for information sharing and exchange, but the security requirements put pressure on the development and implementation of new theories and technologies such as the block chain technology.

What is the thermal conductivity of smart firewalls? We tested the thermal conductivity of smart firewalls at normal conditions by a steady-state method. At 25 °C, the thermal conductivity of smart firewalls is 360 mW m<sup>-1</sup> K<sup>-1</sup>.

What is the target for energy storage? The Department of Energy (DOE) target for energy storage is less than \$0.05 kWh<sup>-1</sup>, a 3a<sup>2</sup>5a<sup>2</sup> times reduction from today's state-of-the-art technology. Fig. 4.

Do firewalls have thermally triggered switchable thermal physical properties? We demonstrate that the firewalls have thermally-triggered switchable thermal physical properties because of the synergistic effect of non-flammable phase change materials (NFPCM) and flexible silica nanofiber mats.

How to implement the energy platform? In order to implement the energy platform, there is significant work to develop enabling technologies such as energy storage, power electronics, and mathematical and computing tools. Control and optimization of a large number of devices and players to
