

The value of energy storage for deferring transmission upgrades is tightly linked with the cost of storage, the cost of transmission upgrades, and the rate of load growth. Energy storage can be a cost-effective solution if it can substantially delay needed investments in the transmission network.

performed with the energy storage deployed in the system. For the example of meeting a frequency nadir specification after a contingency, not deploying energy storage might result in a higher probability of under-frequency load shedding and damage to equipment. Deploying energy storage might virtually eliminate these potential costs. The
