## FENGDAN FIXED ENERGY STORAGE DEVICE

What is fixed energy storage? Fixed energy storage refers to energy storage equipment installed in a fixed position, which can improve the stability and reliability of the power system. Fixed energy storage has a large storage capacity and stability, suitable for long-term operation and can meet large-scale power storage needs.

What are flexible energy storage devices (fesds)? Consequently, there is an urgent demand for flexible energy storage devices (FESDs) to cater to the energy storage needs of various forms of flexible products. FESDs can be classified into three categories based on spatial dimension, all of which share the features of excellent electrochemical performance, reliable safety, and superb flexibility.

Can a fixed and mobile energy storage system improve system economics? Tech-economic performance of fixed and mobile energy storage system is compared. The proposed method can improve system economicsand renewable shares. With the large-scale integration of renewable energy and changes in load characteristics, the power system is facing challenges of volatility and instability.

Why does fixed energy storage capacity change in Beijing-Tianjin-Tangshan area? This is because,Beijing-Tianjin-Tangshan area has a large loadand requires large fixed energy storage capacity. Unlike that,the planned capacity of fixed energy storage in Zhangjiakou and Chengde change little from 2030 to 2040,while it changes in multiples of single digits from 2040 to 2050.

Is mobile energy storage a viable alternative to fixed energy storage? Mobile energy storage can improve system flexibility, stability, and regional connectivity, and has the potential to serve as a supplement or even substitute for fixed energy storage in the future. However, there are few studies that comprehensively evaluate the operational performance and economy of fixed and mobile energy storage systems.

Why do we need electricity storage? Compared with heat and cold energy, electricity is more suitable for long-distance transmission. Therefore, in the grid side, electricity storage must be carried out to solve the large difference between peak and valley power and increase the share of renewable energy generation.
