

FERROELECTRIC THIN FILM ENERGY STORAGE

Are flexible ferroelectric films suitable for energy storage and electrocaloric refrigeration? Flexible ferroelectric films with high polarization hold great promise for energy storage and electrocaloric (EC) refrigeration. Herein, we fabricate a lead-free Mn-modified $0.75\text{ Bi}(\text{Mg} 0.5 \text{ Ti} 0.5) \text{O}_3$ / 0.25 BaTiO_3 (BMT/BTO) thin film based on a flexible mica substrate.

What is the energy storage density of ferroelectric film? Meanwhile, a good energy storage density of 70.6 J cm^{-3} and a quite high efficiency of 82% are realized in the same ferroelectric film, accompanied by excellent stability of frequency and electric fatigue (500 kHz and 10^8 cycles). Furthermore, there is no apparent variation in performance under different bending strains.

How can flexible ferroelectric thin films improve energy storage properties? Moreover, the energy storage properties of flexible ferroelectric thin films can be further fine-tuned by adjusting bending angles and defect dipole concentrations, offering a versatile platform for control and performance optimization.

What is the recoverable energy storage density of PZT ferroelectric films? Through the integration of mechanical bending design and defect dipole engineering, the recoverable energy storage density of freestanding $\text{PbZr}_{0.52}\text{Ti}_{0.48}\text{O}_3$ (PZT) ferroelectric films has been significantly enhanced to 349.6 J cm^{-3} compared to 99.7 J cm^{-3} in the strain (defect)-free state, achieving an increase of 251%.

Which ferroelectric materials improve the energy storage density? Taking PZT, which exhibits the most significant improvement among the four ferroelectric materials, as an example, the recoverable energy storage density has a remarkable enhancement with the gradual increase in defect dipole density and the strengthening of in-plane bending strain.

FERROELECTRIC THIN FILM ENERGY STORAGE

What are the characteristics of ferroelectric thin films? Ferroelectric thin films exhibit tensile strain, strain gradient, and defect dipole states. b) The double-well potential of Landau free energy with the strain (defect)-free state (blue curve) and with strain and strain gradient engineering as well as defect engineering (red curve).

The BNTZ_{0.99}BFO thin film shows a first-class-level W reco (1/4 124 J cm⁻³) along with high η (1/4 81.9%), which surpasses almost all the Pb-contained and Pb-free perovskite ferroelectrics.

By controlling the annealing temperature of the amorphous-crystalline coexisted films, the effect of crystallinity on the energy storage performance was systematically analyzed, a high discharge energy storage density (65 J/cm³) with high efficiency (75%) are obtained in the thin film under low annealing temperature 550 °C. The study confirms

By introducing super tetragonal nanostructures into glassy ferroelectric with MPB composition, a giant energy storage density of 86 J cm⁻³ with a high energy efficiency

The (Na_{0.5}Bi_{0.5})TiO₃ relaxor ferroelectric materials have great potential in high energy storage capacitors due to their small hysteresis, low remanent polarization and high breakdown electric field. In this work, (Na_{0.5}Bi_{0.5})TiO₃ thin films with ~400 nm were prepared on (001) SrTiO₃ substrate by pulsed laser deposition technology. The (Na_{0.5}Bi_{0.5})TiO₃ films

FERROELECTRIC THIN FILM ENERGY STORAGE

In the past years, several efforts have been devoted to improving the energy storage performance of known antiferroelectrics. Polymers and ceramic/polymer composites can present high breakdown fields but store modest energy densities and typically suffer from poor thermal stability (6, 7). Several works have reported noticeable energy densities in samples of ???

In our previous work (W. Zhang et al., Space-charge dominated epitaxial BaTiO₃ heterostructures, Acta Mater. 85 (2015) 207-215), it was demonstrated that a space charge dominated BaTiO₃ thin film can have much improved energy storage characteristics when compared with a regular insulating film of ferroelectric BaTiO₃. However, the improved ???

By introducing super tetragonal nanostructures into glassy ferroelectric with MPB composition, a giant energy storage density of 86 J cm⁻³ with a high energy efficiency of 81% was obtained under a moderate field of 1.7 MV cm⁻¹ in a thin film of conventional ferroelectrics, i.e., 0.94(Bi, Na)TiO₃-0.06BaTiO₃. The ultrahigh energy

Structural design optimizes the energy storage performance of various typical ferroelectric materials. a) Pz-Ez hysteresis loops for 5 nm thin films of BTO, BFO, KNN, and PZT under a range of

In this work, a detailed experimental investigation of energy storage properties is presented for 10 nm thick silicon-doped hafnium oxide anti-ferroelectric thin films. Owing to high field induced polarization and slim double hysteresis, an extremely large ESD value of 61.2 J/cm³ is achieved at 4.5 MV/cm with a high efficiency of 1/4 65%.

FERROELECTRIC THIN FILM ENERGY STORAGE

The lead-based thin film capacitors such as $\text{Pb}(\text{Zr}_{1-x}\text{Ti}_x)\text{O}_3$ (PZT) have been widely researched in the past fifty years. However, toxicity of lead limits their integration in future devices. Therefore, lead-free materials with excellent dielectric and energy storage properties are of great interest [3, 4] using a well-known ferroelectric, $\text{Bi}_{0.5}\text{Na}_{0.5}\text{TiO}_3$ (BNT) with ???

Antiferroelectric thin films have attracted blooming interest due to their potential application in energy storage areas. $\text{Pb}(\text{La}_{1-x}\text{Hf}_x\text{O}_3)$ (PLHO-x, $x = 0 \text{ to } 0.05$) thin films were fabricated on $\text{Pt}(111)/\text{TiO}_2/\text{SiO}_2/\text{Si}$ substrates via the chemical solution deposition method. The x-ray diffraction and high-resolution transmission electron microscopy results show that the ???

The properties in energy storage of ferroelectric thin films are evaluated using two main metrics. The first metric is the ability of the films to store electrical energy, which can be quantified by the energy storage density (W_{rec}). The second indicator is the efficiency in utilizing the electrical energy, which is evaluated by the energy

Flexible ferroelectric films with high polarization hold great promise for energy storage and electrocaloric (EC) refrigeration. Herein, we fabricate a lead-free Mn-modified $0.75\text{Bi}(\text{Mg}_{0.5}\text{Ti}_{0.5})\text{O}_3 \cdot 0.25\text{BaTiO}_3$ (BMT??BTO) thin film based on a flexible mica substrate. Excellent EC performance with maximum adiabatic temperature change ($\Delta T \approx 1/4 \text{ to } 23.5 \text{ K}$) and ???

FERROELECTRIC THIN FILM ENERGY STORAGE

In-situ atomic visualization of structural transformation in $\text{Hf}_{0.5}\text{Zr}_{0.5}\text{O}_2$ ferroelectric thin film: The energy storage density in HZO thin films was optimized through a three-pronged

Fatigue-Free Aurivillius Phase Ferroelectric Thin Films with Ultrahigh Energy Storage Performance. Zhongbin Pan, Zhongbin Pan. School of Materials Science and Chemical Engineering, Ningbo University, Ningbo, Zhejiang, 315211 China Although great strides have been made in the development of ferroelectric ceramic and thin films for capacitors

Currently, common-utilized dielectric capacitors developed for energy storage include thin films, polymer-based thick films, and ceramic materials 1,10,13,14,15,16,17,18,19. Among the candidate

Although the current energy densities of ferroelectric thin films have reached the level of $\sim 100 \text{ J/cm}^3$, the total stored energies are still small due to the use of a thick, passive substrate. Two common approaches to increase the total ???

As can be seen in Fig. S1(a), the relaxor ferroelectric $\text{Pb}_{0.9}\text{La}_{0.1}(\text{Zr}_{0.52}\text{Ti}_{0.48})\text{O}_3$ (PL) thin film has a slim P-E loop with low P_r and E_c values and therefore exhibits very large U_{reco} and ?? values [19, 22]. Further, the normal ferroelectric $\text{Pb}(\text{Zr}_{0.52}\text{Ti}_{0.48})_{0.99}\text{Nb}_{0.01}\text{O}_3$ (PN), which shows strong imprint behavior (imprint is usually attributed to the ???

FERROELECTRIC THIN FILM ENERGY STORAGE

This study investigates the effects of hot-pressing temperatures on the dielectric, ferroelectric, and energy storage properties of solvent-casted Poly (vinylidene fluoride-trifluoroethylene) (PVDF-TrFE) films. The hot-pressing process enhances the crystallinity and alignment of polymer chains, directly affecting their electrical properties. The aim is to optimize ???

In this work, a detailed experimental investigation of energy storage properties is presented for 10 nm thick silicon-doped hafnium oxide anti-ferroelectric thin films. Owing to high field induced polarization and slim double hysteresis, an extremely large ESD value of 61.2 J/cm³ is achieved at 4.5 MV/cm with a high efficiency of ?? 1/4 65%.

Peng, B. et al. Large energy storage density and high thermal stability in a highly textured (111)-oriented Pb 0.8 Ba 0.2 ZrO₃ relaxor thin film with the coexistence of antiferroelectric and

Request PDF | Silicon-doped hafnium oxide anti-ferroelectric thin films for energy storage | Motivated by the development of ultracompact electronic devices as miniaturized energy autonomous

This review focuses on the recent progress of PZ-based anti-ferroelectric films for energy storage, and provides various ways, such as element modification (replacing of one element in the ABO₃ structure by another element), composite materials (adding secondary phase into PZ films to form composite films), and process improvement (such as the

Compared to other dielectric materials like polymers, oxide-based ferroelectric materials typically exhibit higher P_{max} and P_r due to their larger spontaneous polarization, promising for energy storage [2], [6], [7]. A classic approach to promote energy storage performance involves combining ferroelectrics with materials of a different structure to reduce ???

Relaxor ferroelectric capacitors receive extensive attention for the energy storage applications due to their slim polarization???electric field hysteresis loops. Typically, relaxor ferroelectrics can be designed through introducing multiple heterovalent cations in the ferroelectrics to break the long-range ferroelectric order and form polar nanoregion. Here, ???
