As this solar power supply provides maximum 681mA current, any battery or circuit which takes the maximum current of 681mA can be connected to it.

How a solar panel is used to charge a battery? Once the voltage drawn from the solar panel is regulated to desired levels it can be utilized for powering load circuits. In the project, the regulated voltage is utilized to charge a battery. The project involves deriving DC voltage from the solar panel, regulating input voltage, voltage adjustment, and back current protection.

The first part is the power optimizer, which handles DC to DC and optimizes or conditions the solar panel's power. There is one power optimizer per solar panel, and they keep the flow of energy equal. For example, with a standard string inverter, if one solar panel produces less energy, all the solar panels in that string will produce less energy.

Building energy consumption occupies about 33 % of the total global energy consumption. The PV systems combined with buildings, not only can take advantage of PV power panels to replace part of the building materials, but also can use the PV system to achieve the purpose of producing electricity and decreasing energy consumption in buildings [4].
