

# HOW TO STORE ENERGY IN BIOGAS POWER GENERATION

How can biogas be converted to electricity and renewable fuels? Biogas can be converted to electricity and renewable fuels through different technologies and prime movers. Prime movers that can be used for biogas power generation include gas and steam turbines, diesel engines, Otto cycle engines, Stirling engines as well as direct conversion in fuel cells.

How is biogas used? There are various utilization pathways for both raw and upgraded forms of biogas ; commercial methods include electricity and heat generation via combined heat and power (CHP) units, electricity generation via fuel cells, and conversion to mechanical energy for transport via internal combustion engines (ICEs).

Can biogas be used as a fuel for electricity production? Various conversion technologies and prime movers can be used in electricity production with biogas as a fuel. Common devices and prime movers for power production from biogas are internal combustion engine i.e. diesel and gasoline engines used as dedicated gas engines, or dual fuel and bi-fuel engines.

How is biogas stored? The biogas is also stored at a 5-6 bar in low-pressure storage vessels for more accessible transportation and distribution. The DisPred (Distributed Predigester) model (G4 biogas plants) of GPS Renewables has two units: (1) liquid composters and (2) gas generation unit (GGU).

How does a biogas generator work? A biogas generator works by using biogas as fuel for combustion engines. The engines convert the biogas to mechanical energy, powering an electric generator to produce electricity. Most generators produce alternating AC electricity; they are therefore also called alternators or dynamos.

What technologies are available for biogas conversion? Many technologies and prime movers are available for conversion of biogas to useful energy and electricity. The systems include the use of Stirling engines, gasoline engines, diesel engines, boilers and steam turbines, fuel cells, and gas turbines.

Where local heat off-take is available, the economic case for biogas co-generation is stronger than for an electricity-only plant. This is because co-generation can provide a higher level of energy efficiency, with around 35% efficiency.

Biogas is competitive, viable, and generally a sustainable energy resource due to abundant supply of cheap feedstocks and availability of a wide range of biogas applications in heating, power generation, fuel, and raw materials for further processing.

Biogas makes up 1.4 percent of Australia's energy mix, but it has huge potential to not only create renewable energy but also act as a greenhouse gas abatement measure. Biogas does require another step to turn it into electricity.

Biogas CHP technologies. Stirling engine: available in a power range between a few tens of kW to about 4 MW. Mainly small installations with domestic applications. The electrical efficiency is around 30%.
