

## HOW TO TRANSLATE LEAD-ACID ENERGY STORAGE BATTERY

How do lead-acid batteries work? In this process, electrical energy is either stored in (charging) or withdrawn from the battery (discharging). There are two general types of lead-acid batteries: closed and sealed designs. In closed lead-acid batteries, the electrolyte consists of water-diluted sulphuric acid.

Are lead-acid batteries a good choice for energy storage? Lead???acid batteries have been used for energy storagein utility applications for many years but it has only been in recent years that the demand for battery energy storage has increased.

What are the applications of lead-acid batteries? Applications of lead-acid batteries in medium- and long-term energy storageWhile the energy density and cycling characteristics of Pb-acid battery technology are inferior to competing technologies, these are offset to a large degree by the low cost and high maturity level of the industry.

What is a lead acid battery? Lead???acid batteries may be flooded or sealed valve-regulated (VRLA) types and the grids may be in the form of flat pasted plates or tubular plates. The various constructions have different technical performance and can be adapted to particular duty cycles. Batteries with tubular plates offer long deep cycle lives.

Does stationary energy storage make a difference in lead???acid batteries? Currently,stationary energy-storage only accounts for a tiny fraction of the total salesof lead???acid batteries. Indeed the total installed capacity for stationary applications of lead???acid in 2010 (35 MW) was dwarfed by the installed capacity of sodium???sulfur batteries (315 MW),see Figure 13.13.

## HOW TO TRANSLATE LEAD-ACID ENERGY STORAGE BATTERY

How does a lead-acid battery cell work? A lead-acid battery cell consists of a positive electrode made of lead dioxide (PbO2) and a negative electrode made of porous metallic lead (Pb),both immersed in a sulfuric acid (H2SO4) water solution. This solution forms an electrolyte with free (H+and SO42-) ions. Chemical reactions take place at the electrodes:
