Self-luminous wood composites exhibit high latent heat of fusion (146.7 J g⁻¹), suitable phase change temperature at about 37 °C, excellent thermal reliability and thermal stability below 105 °C, which shows self-luminous wood composites are beneficial for thermal energy storage. In addition, self-luminous wood can absorb ultraviolet and

High efficient energy storage devices for both thermal energy and light energy are scarce in the development of modern society to reduce energy consumption. In this work, a novel self-luminous wood composite based on phase change materials (PCMs) with superior thermal energy storage and long afterglow luminescence (LAL) materials with excellent light energy storage is reported.
