

The combined-heat-and-power (CHP) plants play a central role in many heat-intensive energy systems, contributing for example about 10% electricity and 70% district heat in Sweden. This paper considers a proposed system integrating a high-temperature thermal storage into a biomass-fueled CHP plant.

For any country, thermal energy is an important resourceful entity for the economic development [1]. The level of energy consumption increases with the economic development and population in a country [2] creasing fuel costs is forcing industries and governments to increase the power efficiency [3]. With petroleum prices increasing and the ???

Assuming that the storage tank has a uniform temperature T s, and the energy balance on the storage tank gives [4] (1) MC p d T s d t = Q C-Q L-(UA) t (T s-T a), where Q C and Q L are thermal energy of addition or removal from the collector and to the load, respectively, UA(T s ??? T a) is the heat loss from the storage tank to the ambient.

Heat exchangers are devices that transfer thermal energy from one fluid to another without mixing the two fluids. The fluids are usually separated by a solid wall (with high thermal conductivity) to prevent mixing, or they may be in direct contact.. Heat exchangers are typically classified according to flow arrangement and type of construction.. parallel-flow arrangement
