

# NEW APPROACH TO HIGH-VOLTAGE ENERGY STORAGE

Do energy storage plans improve power quality? Energy storage plans can flatten variations, supplying emergency power and peak-load shifting; thus, they significantly manage power supply constancy and improve power quality. The features of energy-storage strategies vary in power-oriented and energy-related storage devices.

What role does energy storage play in the future? As carbon neutrality and cleaner energy transitions advance globally, more of the future's electricity will come from renewable energy sources. The higher the proportion of renewable energy sources, the more prominent the role of energy storage. A 100% PV power supply system is analysed as an example.

How to develop a safe energy storage system? There are three key principles for developing an energy storage system: safety is a prerequisite; cost is a crucial factor and value realisation is the ultimate goal. A safe energy storage system is the first line of defence to promote the application of energy storage especially the electrochemical energy storage.

What are the challenges in the application of energy storage technology? There are still many challenges in the application of energy storage technology, which have been mentioned above. In this part, the challenges are classified into four main points. First, battery energy storage system as a complete electrical equipment product is not mature and not standardised yet.

How can a HESS optimize energy storage & utilization? A well-designed HESS can optimize energy storage and utilization by carefully considering factors like the number and configuration of supercapacitors and batteries and the overall system voltage and power requirements. This approach can contribute to more efficient and sustainable solar energy systems.

# NEW APPROACH TO HIGH-VOLTAGE ENERGY STORAGE

How can a power supply reduce energy storage demand? The addition of power supplies with flexible adjustment ability, such as hydropower and thermal power, can improve the consumption rate and reduce the energy storage demand. 3.2 GW hydropower, 16 GW PV with 2 GW/4 h of energy storage, can achieve 4500 utilisation hours of DC and 90% PV power consumption rate as shown in Figure 7.

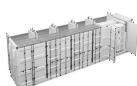

We believe that this approach has a number of significant advantages, over existing mechanical-energy-harvesting technologies, including very high power densities, up to 10 3 W m<sup>-2</sup>, ability to
