The Basics Of Drawn Arc Stud Welding. Drawn arc stud welding is a process by which a metal stud is joined to a metal workpiece by heating both parts with an arc. It permits strong, one-sided welds on base metals with thicknesses starting at 0.048??? (1.2 mm) and produces welds in as little as 0.06 seconds.

The development of medium-frequency-based power for welding in the 1980s was a major contributor to reducing gun weights. Using this technology, a typical gun for welding thin gauge steels (20-kA capacity) could be lightweighted by as much as 50 kg. In a current gun design, the transformer still makes up roughly 50% of the gun weight.

The modeling results show the ways for improving the design of the gun, providing an increase in the concentration of beam energy at the welding joint. Thus, in this example, for a lens working with front segment $b = 300$ mm, the beam diameter in the linear approximation is $d_1 = 1.3$ mm, and the diameter of the circle of spherical aberration is
