When the sun shines on a solar panel, solar energy is absorbed by individual PV cells. These cells are made from layers of semi-conducting material, most commonly silicon. The PV cells produce an electrical charge as they become energised by the sunlight. The stronger the sunshine, the more electricity generated.

Both active and passive solar energy have their pros and cons. However, considering whether active or passive solar is better you need to consider a few points. Power source: Active solar energy does not need any other power source except the sun and passive solar energy relies more on the weather.
