ROUNDED CORNERS

Can I make a solar panel in a custom shape? Yes, it is possible to make a solar panel in a custom shape. At Voltaic, we manufacture custom and standard small solar panels and while most are rectangular, we have experience designing and deploying a full range of interesting shapes and sizes.

Why are solar panels rectangular? Most standard small solar panels are rectangular in shape because they are easier to manufacture and offer the most efficient use of space. Each solar panel is constructed of one or more strings (in series) of individual solar cells. Strung by hand or machine, the strings are in a straight line using equally sized cell pieces.

Why do solar cells have a circular disc? Each wafer thus produced is hence a circular disc. To make the resulting solar cell function properly, its active area must be square so the rounded edges of the wafer get sawn off so the wafers can be packed together as closely as possible during bulk processing. The chamfered corners are left.

Why is cutting a photovoltaic cell a good idea? As silicon prices have fallen, the economics has moved decisively in favour of cutting to make a cell with a more perfect square shape, driving up the panel power by having all of the available area as working photovoltaic material.

Should you slice off a monocrystalline PV panel? The more you slice off, the closer to a square shape you get, and the more working area you can squeeze into your monocrystalline PV panel. The less you slice off, the less material you waste and the cheaper are the cells to manufacture.
