

PQ CONTROL OF ENERGY STORAGE DEVICE

> Does a PV-battery mg improve power quality? Battery Energy Storage (BES) helps maintain stability and balance within the microgrid (MG) under changing conditions. A PV-Series Active Power Filter (APF) improves power quality(PQ) by addressing these challenges. This study presents a comprehensive approach within a PV-battery MG system.

What is PQ mitigation? Filters, controllers, compensators, FACT devices, machine learning tools (MLTs), and conditioners are among the PQ mitigation approaches discussed. These strategies are critical in controlling harmonics, adjusting power, and ensuring voltage stability in the power system network.

How does the energy management algorithm work? The energy management algorithm demonstrates robust performance, continuously adjusting the power supply to meet the load requirements. Even in scenarios where the combined output of the PV system and battery is insufficient, the grid is seamlessly integrated into the system to ensure that the load demand is fully met.

How does the MG power control system work? The system aims to regulate power dynamics to manage fluctuations in power generation and consumption efficiently. The fluctuations in the battery, as shown in Fig. 10 (P B), demonstrate instances where there is excess power available compared to the MG power demands.

What is energy management in a microgrid? Energy management in the microgrid: PV,battery,grid,and load power. The variations in solar irradiation result in different power generation patterns from the PV array,as shown in the graphical representations in Fig. 10 (P PV).

## PQ CONTROL OF ENERGY STORAGE DEVICE

How does the energy management system work? The EMS strategically allocates resources, optimizing the use of available energy to maintain a balance between supply and demand. This not only maximizes the system's efficiency but also minimizes operational costs and environmental impact, ensuring a resilient and sustainable energy supply within the MG.
