What is a DC link capacitor? A DC link is typically connected to a rectifier (or other DC source such as a battery) and an inverter. A DC link capacitor is used as a load-balancing energy storage device. This capacitor is connected in parallel between the positive and the negative rails and helps prevent the transients on the load side from going back to the input side.

Abstract: In active phased array radar, the T/R modules are powered by a low-voltage pulsed power supply (PPS). When the pulse repetitive frequency (PRF) is quite low, bulky storage capacitor or input LC filter is often used in the PPS, resulting in a low power density. The two-stage PPS and the active capacitor converter (ACC) based PPS can greatly reduce the ???

In a dc pulsed power supply (PPS), its instantaneous output power is pulsed, and its input power is required to be constant. 1 Introduction. For a long time, capacitors as energy storage elements have been widely used in power supplies in various systems [] spite the good features of these elements such as high reliability, large capacity and easy control, the large volume of the capacitors greatly limits the mobility of the systems which is a weakness in practical ???

One important characteristic associated with many pulse power applications is the low duty ratio, D , PS, V_{dc} charges an energy storage capacitor bank C_{dc} . The PS internal resistance added by the switch and wiring ohmic resistances is represented by R_{dc} that limits the maximum charging current.

Further from the PA, possibly closer to the power supply or in a nearby power control board, large storage capacitors offer another method for reducing pulse droop. Storage capacitors maintain the voltage generated by the source during the pulse, relieving the switching regulator from handling the increased power load.
