Can a micro-pumped hydro energy storage system save solar energy? One innovative solution the UNSW-led research team proposed is the concept of micro-pumped hydro energy storage systems. These systems store excess solar energy from high-production periods by pumping water from low-lying to high-lying reservoirs.

What is pumped hydro energy storage? Pumped hydro energy storage is a method of storing and generating electricity by moving water between two reservoirs at different elevations. Excess power is used to pump water from the lower reservoir to the upper reservoir during off-peak periods, and the stored water is released back to generate electricity when demand increases.

Can micro-pumped hydro energy storage systems reduce energy shortages? This stored energy can be released as needed, balancing energy supply and demand and reducing the risk of shortages and overloads. One innovative solution the UNSW-led research team proposed is the concept of micro-pumped hydro energy storage systems.
