We study the effects of entanglement and control parameters on the energy landscape and optimization performance of the variational quantum circuit. Through a systematic analysis of the Hessian spectrum, we characterize the local geometry of the energy landscape at a random point and along an optimization trajectory. We argue that decreasing the entangling ???

Quantum physics reveals that space, even when devoid of atoms, is never completely empty. What may seem like a vacuum still contains tiny fluctuations in quantum fields, often referred to as zero-point energy. These flickers of energy can be harvested using quantum energy teleportation (QET), a concept proposed by Masahiro Hotta in 2008.
