Energy storage industry put on fast track in China-Xinhua . The country's installed new-type energy storage capacity had reached 31.39 gigawatts by the end of 2023, of which 22.6 gigawatts was newly installed in that year alone, which was nearly 10 times that at the end of 2020, according to the National Energy

High-capacity or high-voltage cathode materials are the first consideration to realize the goal. Among various cathode materials, layered oxides represented by LiMO_2 can produce a large theoretical capacity of more than 270 mAh/g and a comparatively high working voltage above 3.6 V, which is beneficial to the design of high energy density LIBs [3].

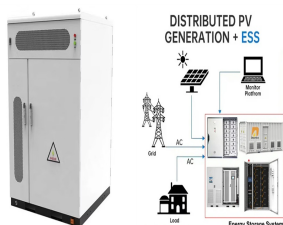

This reduction in distance, combined with a larger electric field formed in the proximity of the electrodes and higher dielectric permittivity, allows for significantly greater energy storage. Developing new active materials with a much larger surface area of 1000-2000 m² g⁻¹ enhances the storage capacity of supercapacitors even further .

Moreover, as demonstrated in Fig. 1, heat is at the universal energy chain center creating a linkage between primary and secondary sources of energy, and its functional procedures (conversion, transferring, and storage) possess 90% of the whole energy budget worldwide [3]. Hence, thermal energy storage (TES) methods can contribute to more ???
