What is the reason for energy storage in higher animals? An energy storage formation method appeared in higher animals because intraspecific and interspecific competition for the niche of habitation demands a great deal of energy expense in the short run.

What happens to an animal's energy reserve during irradiation? During irradiation, the energy reserve of the body turns into heat proportionally to the irradiation dose. Such heat production increase can be provided only on account of the energy reserve of the body itself. Death of animals happens for the reason that the energy reserve, which the body must consume for the day-time, is depleted.

Why is sleep important for animals? Sleep is important for animals because such an increase [of lymphocytes able to produce ATF molecules] seems to occur during the rest time (sleep). For the storage formation, a recurrent increase of the number of lymphocytes able to produce ATF molecules is necessary.

How can energy funds be stored in the body? For quick consumption, energy should be stored in the form of ATP (adenosine triphosphate) molecules. Scientists have long tried to find a depot of ATP molecules in the body, from where these molecules could be delivered to working cells by the blood flow. However, no ATP molecules were detected in the blood.

What are old animal storage effects? Empirical tests and meta-analyses of old animal storage effects across taxa related to life history, knowledge, sociality, cultural transmission, reproduction, recruitment, biomass accumulation, population replenishment, demographic buffering, trophic cascades, and food web structure and stability.
