

THE LOW VOLTAGE SWITCH ENERGY STORAGE LIGHT IS NOT ON

What if the battery voltage is too low? Ensure that the battery voltage is within the correct range. The battery voltage is low. Charge the battery or check the battery connections. Low battery??? LED lights. The converter switches off because the battery voltage is too low. Charge the battery or check the battery connections.

Why is the inverter switched off? The inverter is switched off due to an excessively high ripple voltage on the input. Install batteries with a larger capacity. Fit shorter and/or thicker battery cables, and reset the inverter (switch off, and then on again). One alarm LED lights and the second flashes. The inverter is switched off due to alarm activation by the lighted LED.

How to prevent battery shock? This will help prevent battery shock caused by the inrush current of the large capacitors in the inverter. Step 1: Press and hold the SW button of the master battery for three seconds.

What should I do if a switch-over system is not working? Switch-over system protection initiated. Should not occur in correctly installed equipment. Switch all equipment off, and then on again. If the problem recurs, check the installation. Firmware incompatibility. The firmware of one of the connected devices is not sufficiently up to date to operate in conjunction with this device.

What is a voltage sense error? Voltage sense error. The voltage measured at the voltage sense connection deviates too much (more than 7V) from the voltage on the positive and negative connection of the device. There is probably a connection error. The device will remain in normal operation. Absorption and float LEDs flash synchronously (simultaneously).
