

# THE PROSPECTS OF GEOTHERMAL ENERGY STORAGE

What is geothermal energy storage? Geothermal Energy Storage is explored as a key strategy for large-scale storage of renewable energy. Effective or improved energy conservation is essential as energy needs rise. There has been a rise in interest in using thermal energy storage (TES) systems because they can solve energy challenges affordably and sustainably in various contexts.

Why is deep geothermal exploitation important? Large-scale exploitation and utilization of deep geothermal resources is conducive to optimizing primary energy mix and improving comprehensive energy utilization efficiency. Moreover, it is of great significance to establishing a safe, stable and diversified regional energy supply system.

Can geothermal energy storage be used in large-scale energy storage? The Geothermal Energy Storage concept has been put forward as a possibility to store renewable energy on a large scale. The paper discusses the potential of UTES in large-scale energy storage and its integration with geothermal power plants despite the need for specific geological formations and high initial costs.

What is a geothermal system? Geothermal systems are regions in the Earth's crust where this flux and the associated energy storage, often manifested in flowing hot water and/or steam, are abnormally great. Geothermal resources constitute the only renewable energy resource not originating in the Sun.

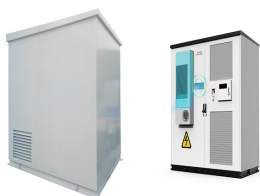

Why do we need deep geothermal resources? As a clean and environmentally friendly non-fossil energy resource and a stable and reliable local energy resource, the deep geothermal resources are supposed to be developed in large scale, which will be of great significance to guaranteeing national energy security and achieve the goal of "Carbon Peak and Carbon Neutrality".

# THE PROSPECTS OF GEOTHERMAL ENERGY STORAGE

What is the future scope of geothermal battery energy storage? The future scope of geothermal battery energy storage is to fulfill the energy demand over the entire period of time by injecting hot water into the reservoir and then production of this hot water later whenever required when solar energy is unavailable.

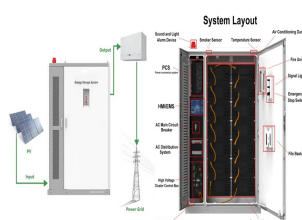

The prospects for methanol storage are more substantial, with an estimated  $5.8 \times 10^{11}$  and  $1.2 \times 10^{12}$  kW?h by 2030 and 2060, respectively. At present, with the combination ???

Energy is essential in our daily lives to increase human development, which leads to economic growth and productivity. In recent national development plans and policies, numerous nations ???

Geothermal energy accounted for only 0.1 % of the world's primary energy supply in 2008, but projections suggest that it might meet ?? 1/4 3 % of global power demand in the future, ???

Based on the geothermal resource conditions, the current situation of China's geothermal energy utilization in heating (cooling), power generation, hot spring bathing, high-end seed breeding, and
