

What role does energy storage play in the future? As carbon neutrality and cleaner energy transitions advance globally, more of the future's electricity will come from renewable energy sources. The higher the proportion of renewable energy sources, the more prominent the role of energy storage. A 100% PV power supply system is analysed as an example.

What are the challenges in the application of energy storage technology? There are still many challenges in the application of energy storage technology, which have been mentioned above. In this part, the challenges are classified into four main points. First, battery energy storage system as a complete electrical equipment product is not mature and not standardised yet.

How will energy storage systems impact the developing world? Mainstreaming energy storage systems in the developing world will be a game changer. They will accelerate much wider access to electricity,while also enabling much greater use of renewable energy, so helping the world to meet its net zero, decarbonization targets.

Is energy storage a precondition for large-scale integration and consumption? So to speak, energy storage is the precondition of large-scale integration and consumption of RES. However, China's energy storage industry is at the exploration stage and far from commercialization. This restricts the development of RES to certain extent. For this reason, this paper will concentrate on China's energy storage industry.

Why is energy storage industry in China a big problem? Judging from the present condition, cost problem is the main barrier. And the high performance and high security of the relative technology still need to be improved. Until 2020, energy storage industry in China may not be spread massively and the key point during this period is the technology research.

Why is energy storage technology needed in China? In China,RES are experiencing rapid development. However,because of the randomness of RES and the volatility of power output,energy storage technology is needed to chip peak off and fill valley up,promoting RES utilization and economic performance.
